NDLW 2023 Strategy a Day

## EVMS
INSTRUCTIONAL DESIGN & TECHNOLOGIES

Day 1: Basics of AI

Artificial Intelligence (AI) is a field of computer science that focuses on creating intelligent machines that can think and learn from humans. AI systems learn from data and improve their performance over time without being explicitly programmed.

AI uses a variety of techniques to learn and make decisions including machine learning, deep learning, and natural language processing (NLP).
There are two types of AI: Narrow AI, which is designed to perform a specific task (like driving a car), and General AI, which is designed to be as intelligent as humans and perform human tasks.

AI is used in a variety of industries like healthcare, finance, transportation, customer service, and manufacturing

The future of AI:
- AI is being used to develop medicines and treatments
- AI is expected to create 90 million jobs by 2030
